New tonearm TA-10 from a.c.haller - swissness at it's best

a.c.haller now presents the tonearm TA-10. New design approaches were implemented in the development of the height-adjustable high-end tonearm. What is unique is the high-strength compound, a material that enables a seamless, thick-walled construction of the tube up to the counterweight. The non-contact function of the anti-skating is elegantly integrated into the base and can be infinitely adjusted thanks to a sophisticated, innovative arrangement of magnets. The arm is compatible with the Stand adapter system, a world first from a.c.haller, which optimizes the easy replacement of tonearms.

Resonances are effectively minimized thanks to the special compound used by a.c.haller. The new material is highly acoustically dampening and at the same time very torsion-resistant. The arm is gimbaled in miniature ball bearings and has excellent tracking properties. The counterweight mounted near the pivot point serves as a counterforce, which is supplemented by an adjustable additional weight. The TA-10 can be adjusted in height by loosening a rotating ring. The internal wiring is made of oxygen-pure copper and is designed for 5-pin SME cable connection. The TA-10 is currently available in two versions; Shiny polished in elegant black or in a matt black finish. Each of them is an eye-catcher and an audiophile exquisite. Optimally operated on the Gramphones from a.c.haller, this combination allows you to experience innovative audio engineering and precision - swissness at it's best.

The internet shop prices for both arms are currently around CHF 2360 or CHF 2740.
